

Clinical-stage claudin-targeting monoclonal antibodies scored against the 25-antigen claudin panel

Orange outline marks each antibody's cognate target. Scores are model-derived and are not measured affinities; differences below ~0.07 units lie within the run-to-run variability of the predictor. eclutatug (ALE.C04) and lixudebart (ALE.F02) share an identical Fv and differ only in the IgG1 Fc, outside the modelled interface, so they score identically and are shown as one row.
